

PROJECTS in the News

The city of Aurora, Colorado deployed the **DVTel Latitude Network Video Management System** to improve the safety and security of the city's court and jail complex. The system includes 286 cameras.

"We have focused on monitoring live video," said Bryan Verhoeff, the Court

IT staff member in charge of the DVTel video management system. "We have a monitor displaying several camera views as people come through the metal detector at the entrance. This serves as a great deterrent."

On the jail side, Verhoeff said, "we've had an increasing number of requests for video footage to use in investigations," adding "the system is proving to be both a good deterrent and a good investigative tool."

An updated fire protection system on the Miles College campus in Alabama uses the **MS-9600UDLS** addressable fire alarm system from **Fire-Lite Alarms**. The system uses an existing IP network for fire alarm reporting to a central sta-

tion operated by fire alarm and security integrator **Protection 1**, thereby eliminating the cost of two phone lines per system. The central station is backed up by four additional UL listed fully redundant monitoring systems.

Protection 1 also installed the new system, which involved four buildings on campus. Each building got its own panel. In addition, the system included 41 new pull stations, 79 addressable smoke detectors, 22 addressable duct detectors and 67 strobe lights.

Edward Jenkins, Miles College physical plant director, said he is impressed with the fire alarm's immediate notification capability and Protection 1's same-day service. "We are really pleased with our experience, not to mention the great service," said Jenkins.
